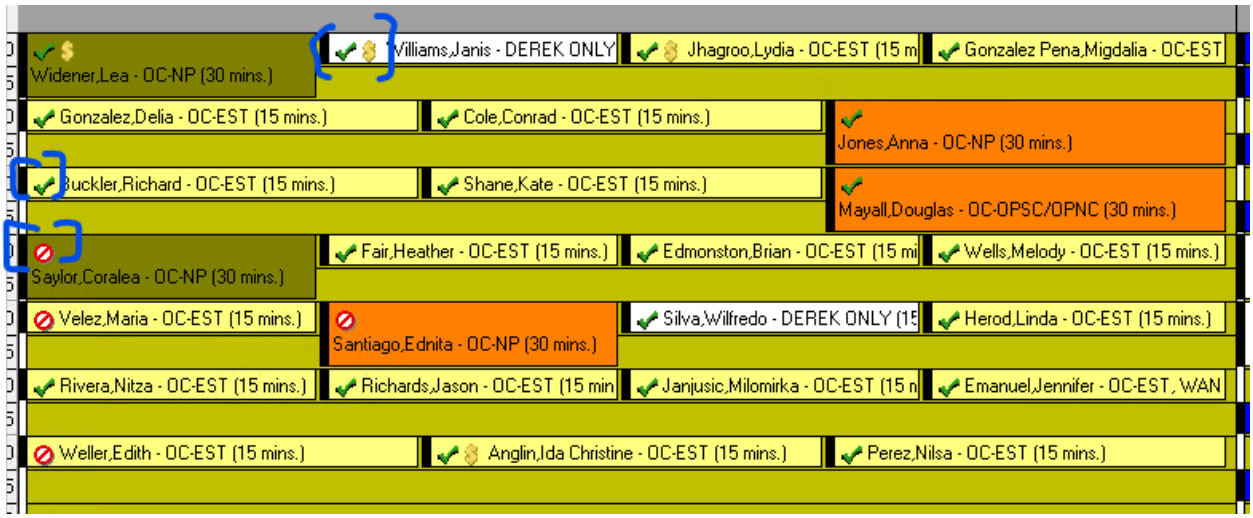
Patient app schedule an appt, -> shows up on the ARCS calendar

- Pt will choose service wants, like Acu, PT or both, that will display on ARCS Calendar



Icons to indicate the status of the appointment

Patient App Sing up

Sign up Patient App

2 types only when signing up PtApp

1. Existing patient who already has records in ARCS with ARCS ID
2. NP: patient who has never been to ARC before

Ways to sign up PtApp

1. Kiosk for patient to scan the QR Code
2. Staff send a link, through email or texting, to patient to download the App [Developer to provide the link for ARC to send out to patient, through email or texting]
3. A link on the Website – QR Code [Developer will provide the link, ARC will manage to embed the link into ARC Website.]

Phone # needed when patient sign up an App account

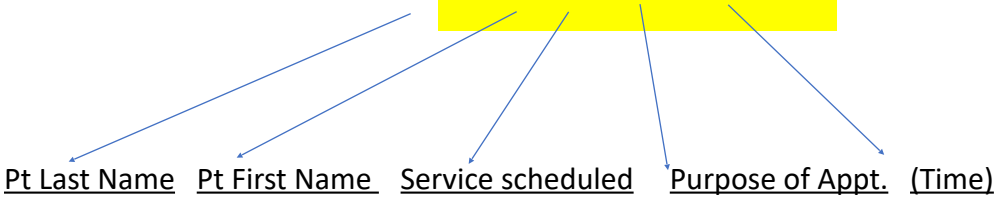
I forgot the sign-up process screen of PtApp at this current version. We need **phone #,** since we are going to use Phone # for patient to sign in using Kiosk.

Definition of Existing patient at time of signing up for an PtApp account:

- **Existing patient** This is for patients who already exists in ARCS with ARCS ID, e.g. patient is currently being treated by ARC, been treated for 4/12, today's visit is 5/12 and ARC is asking patient to download PtApp to manage their future appointments today. [When we roll out ARCS there will be many patients that are in the middle of a treatment POC.]. We need to check that
    - When sign up PtApp will check ARCS to see patient already exists.
- **New Patient**: All others will be NP for PtApp sign up.
    - Since patient does not "exist" in ARCS yet, PtApp will create an ARCS IC for this patient.
    - ARCS will create an account with ARCS ID, last name, first name, phone number for this account.
    - ARCS will notify Staff of new PtApp sign up, so we can gather all other information needed to complete the account set up.
    - ***Future development:***
        - We will be using ARCS Forms to gather patient intake information and ARCS account for that patient will be automatically created after patient push the form back to ARCS. And ARCS ID will also be created when this account is automatically created.: we do not have to take it on current phase

==========

Anatomy of appointment listing: **Wang, John PT - Est. (15 min)**



Pt name is from Patient App [if scheduled by Pt] or Scheduler [if scheduled by ARC]

Service scheduled is choice made by Patient App [if scheduled by Pt] or Scheduler [if scheduled by ARC] types are: PT, Acu or PT/Acu

Purpose of appointment: EST, EST-PP, NP, OPSC, OPNC: Anupam has to clarify, this only shows on the scheduler only not on the patient app.

Time: as set up by the Scheduler Maintenance

EST will be auto entered into Scheduler when pt tries to schedule already have ARCS ID and Active Claims. and it will be yellow color on Scheduler, All others will be "Pending" type of appointment that needs ARC Staff intervention to finalize the appt. Patient will only choose "Service Scheduled" on Patient App. Purpose is only showing on Scheduler and is to be entered by ARC Staff [all except EST type which is automated].

==========

a. PtApp will check again the ARCS DB, to see if that Email exist already, then fetch the ARCS ID and check to see if patient has Active claims

b. if patient has already had an ARCS ID, then we should be able to link Patient App and ARCS account together for Scheduler and communication between ARCS and Patient App [Need to know if this is how Patient App and ARCS is designed for communication at the current programming, I have asked many times about how Patient App is communicating with ARCS, but never really got a good answer.]

c. if ARCS ID already exist active claim, the following needs to show when trying to schedule an appointment using Patient App. How do we will check if patient wants to schedule an appointment for active claim or new claim (changes would be required on ARC web and Patient app both side.)

d. If ARCS ID already exist, but WITHOUT a active claim, then the following screen needs to show for appointment.

e. All these are for us to establish the patient types. (Patient type assignment will happen manually or automatically also based on that we would need to check for above requirements too for pulling existing claims)

2. New Patient

a. Check against ARCS DB

Making an appointment with ARC:

1. **<u>Using Patient App:</u>**

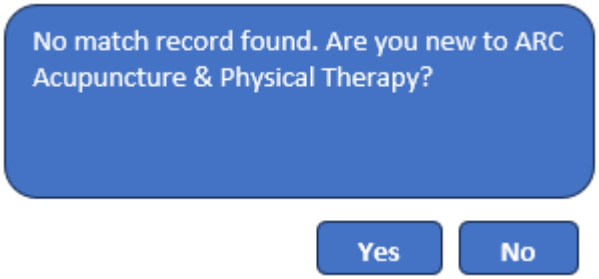
   a. New Patients **NP**

      i. Private pay and MP type of patients: No other checking is needed, proceed to schedule appt. Purpose of visit will show NP-PP.

         - After scheduled, **<u>Success confirmation</u>** will show

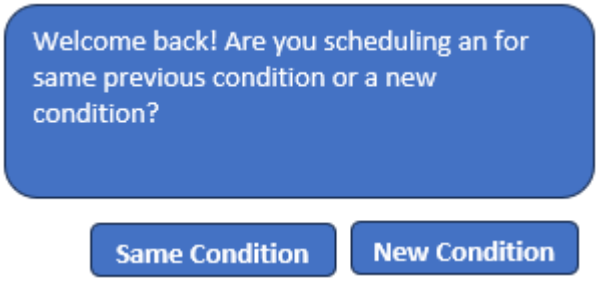
      ii. All other ins type of NP:

         - PtApp check against ARCS, and no matching patient exist, then

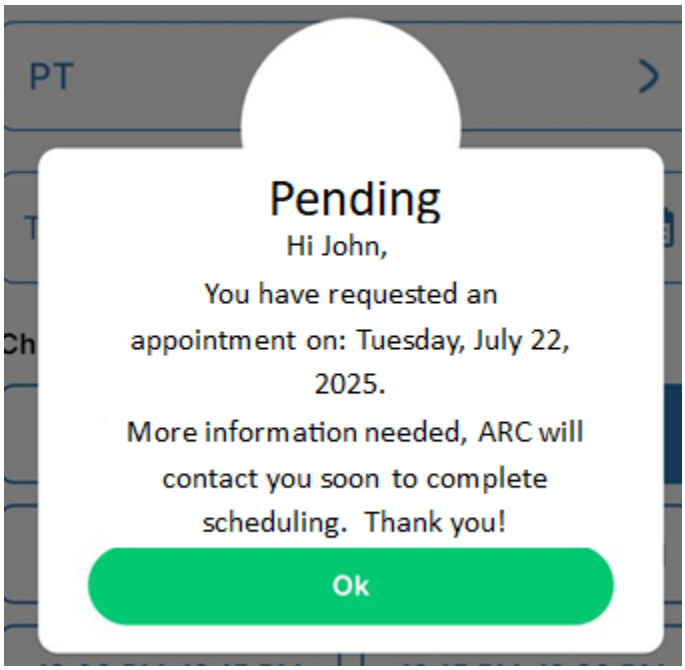


The reason to ask this question is because we have patients on CT, but not on ARCS, so even if PtApp cannot find patient on ARCS, patient might still be an existing patient in CT system. i.e. patient maybe NP in ARCS, but actually an existing patient in CT.

- If **Yes**, proceed to scheduling, visit Purpose will be “NP”
- If **No**, show the following



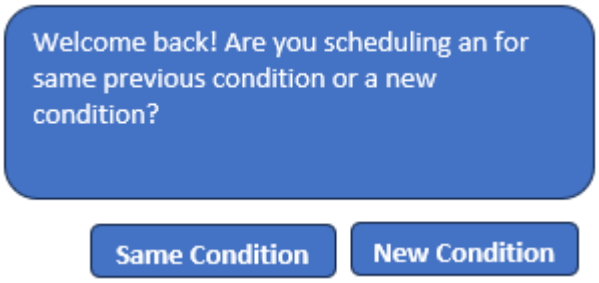
- If Same condition, proceed to scheduling with visit Purpose as “OPSC”.
- If New condition, proceed to scheduling with visit Purpose as “OPNC”.
- After scheduled, the **<u>Pending confirmation</u>** will show



In US, people usually do not pick their phone when an unfamiliar phone # shows up, so we waste a lot of time leaving voicemail. So, communication using PtApp is preferred. Pending type of appt, ARC Staff must be able to initiate a Chat or Voice call using the Call Center to contact the patient. That way we don’t waste time leaving voicemail and hoping patient calls back.

b. Existing patients **without Active Claims**:

i. PtApp check with ARCS and found a match, but there is not active claim, then the following message shows after choose "Appointment" on PtApp. Will this popup come after when patient try to schedule appointment or during click of appointment as well



- If Same condition, proceed to scheduling with visit Purpose as "**OPSC**".
- If New condition, proceed to scheduling with visit Purpose as "**OPNC**".
- After scheduled, the **<u>Pending confirmation</u>** will show

c. Existing patients **with Active Claims**:

i. PtApp check with ARCS and found a match, but there is/are active claim(s), then PtApp will check ARCS claim in the following sequence.

ii. Check ins. Co. visit limitation

- Check Ins. Co visit limit in <u>Ins. Co. Set up</u> for any ins. type other than PP and MP (based on auth ?)
- E.g. Humana Gold+ Acu has a 25 visits per year limit.
- Warning:

You have met the yearly maximum visits allowed by your insurance company. ARC is more than happy to continue your care as Private Pay patient till your next benefit period starts again. if you wish to continue making the appointment, please press "Continue ".

Cancel | Continue

- Upon “Continue”, proceed to check Auth section below before schedule an appt.
- Upon “Cancel”

X

ARC is a dedicated Health Care provider with passion! If you have special concerns, please express them via Live Chat or call our office. Hope to see you in the near future.

iii. Check against **Authorized Time Frame**

- This only applies to Ins. Co that required Auth.
- PtApp will check the Auth section’s auth expiration date. If there are 5 days or more before Auth expiration date, then no warning is needed for Auth Date and will proceed to check Auth Visits.
- If 4 [including 4] days or less before Auth Expiration Date, then show the following warning

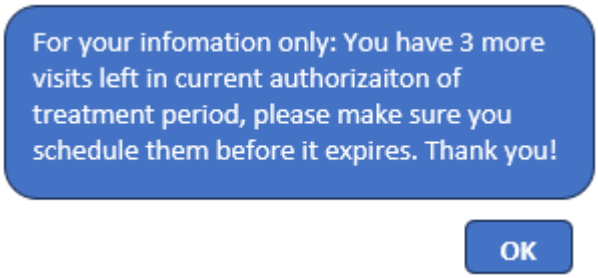
For your infomation only: There are 4 days before your current authorizaiton of treatment expires, please make sure you schedule all your appointments. Thank you!

OK

- After “OK”, proceed to check Auth Visits

iv. Check against the **Authorized visit counts**,

- This only applies to Ins. Co that required Auth.
- E.g. patient is authorized for 8 visits and used 3 visits, then patient will be able to make upto 8 visits.
- Warning will be given starting from 3 authorized visits left, warning as follows:



- After "OK", will proceed to check again POC section below.

v. **Check POC** so patient can make appt to the suggested POC, **(need to discuss how claim relation will happen)**

- e.g. if patient has 4/12 already, they will be able to make another 8 appointments without warning.
- i.e. if patient tries to schedule appt #5-12 using PtApp, PtApp will next check "against Auth of the scheduling will go normally and give a "**Success Confirmation**" with a visit purpose of "**EST**".
- Ideally PT/Acu RA should be done at the end of POC, and ARC Staff should have scheduled all RA appts using ARCS Scheduler, then push all those appt to PtApp.
- But in the case when no future appt was made at end of POC, and patient trying to schedule appt #13, PtApp will allow scheduling, but with a **Pending Confirmation** and a visit purpose of "**EST-No POC**"

d. Management of "Pending" appt.

i. will show up on Scheduler with a color designated for Pending appts. ARC Staff will contact the patient to get information needed to finalize the appt.

ii. For NP: ARC Staff will put this patient on "Potential Patient List". (Patient Records ->Potential Patient Entry)

iii. ARC staff will check all appts with Pending color to finalize appointment, then push that notification to Patient App.

2. Using ARCS Scheduler: only for 2 conditions:

a. Calls for an appt:

i. If patient calls for Appt instead of using Patient App, then ARC Staff will enter patient into ARCS Potential Patient List, make an appt using **Scheduler,** then push that appt to Patient's App [Patient will have to be instructed to download from our website, or send them a link to download the App].

Feature to implemented now or future:

Information needed to push to patient to fill out before appt function: i.e. if patient ins. Co. is Medicare, then all paperwork required by Medicare will be either manually chosen from a menu or send as a package. This option can automatically pop up when pushing NP appt to Patient App?

b. ARCS Staff trying to schedule multiple recurring appts at [1] initial Eval [2] RA based on the recommended POC. Lets do that now

When using the Scheduler, ARCS need to auto check the following criteria

i. Check ins. Plan limitation, such as Humana Gold + has 25 Acu visits per year limit.

ii. Check again authorization, E.g. 1) if ins. Authorize 8 visits, then recurring appts should not be more then visits authorized. E.g. 2) if ins. Co. has a Auth-5 initial Auth rule, then Scheduler will allow 4 visits scheduled. And a warning will be given if try to scheuld the 5th visit and beyond without Auth obtained.

iii. Check again POC, e.g. if POC suggest 2x/wk for 4 wks, then should not allow

Warning function by PatApp

i. Automatic reminder

   a. 2 reminders for Appt

      i. 25 hours before appt. [reminder for appt and for 24 hours cancellation policy to avoid being charged for Cx Fee.

      ii. 7:30 AM on the date of the appointment 2nd reminder.

   b. Reminders for upcoming Auth expiration

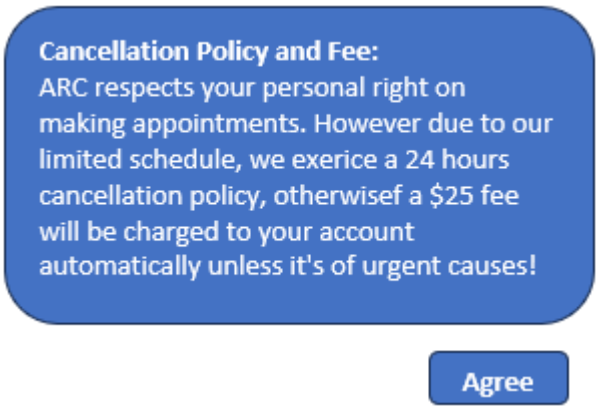
      i. Check and display the warnings about Auth expiration

      ii. ARCS will automatically push the Auth Expiration info to Patient App

         1. 3 or less visits left and

         2. 1wk before expiration date

ii. Cancellation Fee Warning



Cancellation policy and Fair use, will show up and needs Agreement at the time of Signing up to use PtApp.

iii. Fair use

   a. All appointment will be cancelled automatically if you have 3 consecutive cancellations.

   b. You will need to call for an appt by Phone or through Live Chat

   c. Your right of using PtApp to make appt will be restored after you contact the office.

Payment would trackable or not: Anupam needs to check

==========

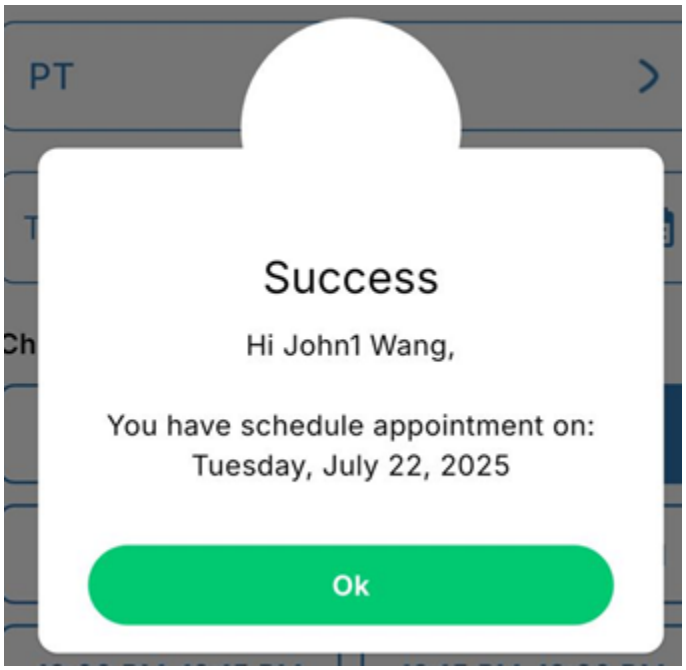
Wang, John PT , Est. (15 min)

Est. means appt. approved and scheduled for Existing patients with Active Claims. All others will be "**Pending**" appointment [waiting for something to be solved, such as ins. Verification, M.D. referral or ins. Auth if required, etc.]

Patient who already has **ARCS ID** and **Existing pt with active claim**

1. No Auth is required:
    a. After press "Schedule" button, the following pop-up message will show:

    Nothing changed; the current message is good enough.



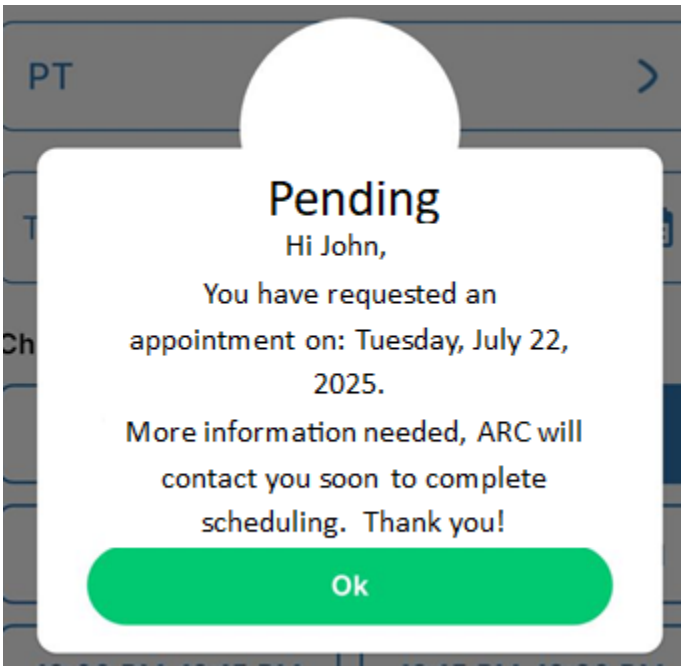
2. Auth is required
3. Visit limitation
    a. AETNA-5
4.

Thank you for scheduling with ARC.

Wang, John PT /Acu, NP (30 min)

Mechanism for Pending Appt. to show on Scheduler [different color], and push the appt. to Patient App after the scheduling request is processed by Staff.

New pt that **does not** have a ARCS ID, when patient sign up his/her Patient App, App will contact the Patient App server to check if that pt's email? Phone # is on file [??? Is this how it's set up?] if not pat will have set up a New Account, which upon Submit will be issued a ARCS ID [this is according to what Amit told me, that Patient App and ARCS are linked using ARCS ID]. When NP try to set up an appt, he/she will get a "Pending" type of confirmation.



An **Appt. Warning Checking Center** is needed, so when pt tries to request an appt. ARCS will check is any warning exists. If there is warning, then the problem should be solved before that appt. can be finalized. Appt. Warning Checking Center will base on [1] Warning section on the Claim set up and [2] Auth setup in Ins. Co. Set up

Wang, John PT /Acu, OPSC (15 min)

Has ARCS ID, but no Active Claim coming back with same problem as before

Wang, John PT /Acu, OPNC (15 min)

Has ARCS ID, but no Active Claim coming back with different problem as before
